

Part 2:

Questions:

1. Which type of ideas do you think apply to Shyp? Why?

I think Simplify and Virtualize best applies to Shyp because it takes a lengthy process and condenses it into a simple all digital one.

2. Which type of ideas do you think apply to Curofy? Why?

Remix best applies to Curofy because it takes an existing idea (LinkedIn) and brings it to a new market (exclusively doctors)

Use Product Hunt to find a relatively new startup and respond to the following about it:

- “Web Search Agents by Nimble” is the name of the product I found. The idea is to have AI research agents to go on the web and do complex searches.
- I think Simplify applies to this because it takes the task of searching on the web and does it for you. I would say this idea addresses users’ needs as very specific research using the web can take a lot of time and energy. With that in mind, I would categorize this idea as a painkiller.
- I would say this idea is easy to monetize as it is simple, easy to describe, and shows promise. Personally, I don’t see myself using this as I don’t regularly do complex research on the web. If I ever want to dive deep into a subject, I’d prefer to read some good articles on it or ask ChatGPT for a breakdown.
- I could see researchers enjoying this idea though so there is potentially a good market. I guess the closest thing to a secret sauce would be the AI agent that is designed to do complex web search but I’m not sure if that is revolutionary in this day and age.

Part 3:

A. Brainstorming:

Problems:

- a. Lack of experiences that make use of the college campus environment
- b. No great way to navigate campus if unfamiliar
- c. No great fun method to educate or showcase something in a class (that is not a slideshow)
- d. No efficient way to rate movies properly without bias

- e. Need a great way to organize homework, quizzes, and school events all in one place

Solutions:

- a. Making a game that requires you to take pictures of certain locations daily; location-based minigames; user is sorted into a one of four groups that competes against the other for most points (similar to Harry Potter); small mystery story that requires user to follow a certain path and go to certain places; resets every semester; encourages walking around campus and exploration
- b. Making an app that has a dedicated interactive map exclusively for campus; has live updates showing shuttle routes, current construction, closed roads, etc; changes routes based on if you are a walker, driver, or on scooter
- c. Making a website that allows you to create educational games easily; users can input their educational material and use a variety of templates of different games to create their own; can craft their own choose-your-own adventure stories; acts as educational material for teachers and a google slides (quizlet, kahoot, etc) alternative for students
- d. Making an app that factors in movie genre and context to guide you to give the most unbiased movie score; ask you certain questions about the movie and have weights based on the genre; recommends movies based on your interests and preferences
- e. A website/app that gives you one clean simple place to organize homework, what you need to do, school events, reminders, etc; syncs with google calendar; AI can help you craft plans and organize schedule; tracks how long a task might take and plans accordingly

Chosen Idea:

- I choose idea “e” because it is the one I would see myself using the most
- The idea itself is not new but the execution could be unique
- It would be useful mainly for students but anyone could use it to schedule their day

B. Product Proposal:

- This product would give students (or anyone) a space to organize their thoughts, plans, assignments, tests, and more

- Simplify and Virtualize apply the most to this as I'm providing a simpler digital alternative to writing down what you have to do
- This is relevant to me because my current method of keeping track of assignments could be so much better; my peers also have not so great ways of doing it
- This product will solve the problem of students being unaware and anxious about future tasks
- The website will be mainly a simple one-page website that tracks everything you want it to
- This product is a painkiller because it directly addresses students' needs
- This product is easy to monetize as it is simple and helpful for the average user
- Students will be the likely users of this product
- The secret sauce will be the combination of simplicity, customization, and AI planning
